

For more information, view our Web site at www.postcaps.com

To activate your new solar post cap:

- Remove top by pressing inward on the side panels adjacent to the on/off switch, grasping the edge of the top and lifting it off.
- Remove plastic tab in the battery compartment to allow connection to terminal.
- Replace top by snapping onto side panels. (Ensure the holes in the sides are matched up with the stubs on the top.)
- Place your solar post cap in direct sunlight for 24-48 hours with the switch in the OFF position to fully charge.
- Once fully charged, turn the switch to the ON position.

Once fully charged, the switch may be left in the ON position. The light will turn itself off in the daylight, allowing the solar cell to recharge the batteries.

If, after fully charged, your post cap does not illuminate in the darkness, please ensure that the switch is in the ON position. Your solar post cap light is now ready to be installed onto your post.

To attach your post cap to the post, apply exterior-grade construction adhesive to the underside of the post cap before placing the cap firmly on the post.
